

# Loui\$iana Fi\$cal Focu\$

Public Affairs Research Council of La., Inc.

The 1992 tax burdens of four hypothetical families with income levels of \$25,000, \$50,000, \$75,000, and \$100,000 living in the largest city of each state, including New Orleans, are examined. The taxes used to calculate the family tax burden include the federal income tax, state and local income taxes, state and local sales taxes, state and local property taxes on residences, and state and local automobile taxes (i.e., motor vehicle gistration fees, gasoline taxes and property taxes). Fees, charges, "sin" taxes and excise taxes were not considered.

## Family Tax Burdens: A National Comparison

PAR assumed that the hypothetical families at each income level had the same spending patterns and housing values, regardless of the city of residence. Thus, any differences in tax burdens reflect differences among state and local tax structures rather than variations in spending choices, purchasing power or housing markets.

The study also compares the tax structures of Louisiana's eight largest cities to those of selected cities in 15 southern states. It further examines the regressivity or progressivity of state and local taxes and the impact of their deductibility for federal income tax purposes. Finally, the major tax proposals in Louisiana's 1993 special and regular legislative sessions are

## Where Louisiana Stands

PAR compared the 1992 taxes paid by four hypothetical families in New Orleans of different income levels to the taxes paid by similar families residing in the largest city of each of the other states. PAR found that a \$50,000 income family in New Orleans would have paid:

- the 13th lowest total taxes;
- the fifth highest federal income tax;
- the highest state and local sales taxes:
- the third lowest residential property taxes;

- a small share of its state and local tax bill (61.5%) in taxes deductible for federal income tax purposes; other cities ranged from 50.0% to as high as 95.4%;
- higher state and local taxes than the same families in Louisiana's seven other largest cities;
- \$163 more in taxes if the governor's 1993 proposed plan to increase gasoline and residential property taxes, and suspend the sales tax exemption had passed, and
- \$63 more in taxes due to the one-cent sales tax on food and utilities added in 1993.

PAR also compared the 1992 taxes of the \$50,000 income family in 30 southern cities, including the eight largest cities in Louisiana. The family's total tax bill was:

- highest in Louisville, Kentucky at \$10,083;
- lowest in Nashville, Tennessee at \$6,530;
- \$7,932 for the 30-city average, and
- \$7,666 in New Orleans; \$7,544 in Shreveport; \$7,205 in Lake Charles; \$7,202 in Alexandria; \$7,005 in Lafayette; \$6,985 in Monroe; \$6,954 in Baton Rouge; and \$6,825 in Houma.

examined by calculating their impact on the hypothetical families' tax burdens.

The basic characteristics of the hypothetical families are as follows:

- earn gross federal income of \$25,000, \$50,000, \$75,000 or \$100,000;
- married with two wage-earning spouses and two school-age children;
- file joint income tax returns and itemize their federal income tax when possible;
- © own one automobile at the \$25,000 and \$50,000 income levels and two automobiles at the \$75,000 and \$100,000 income levels;
- own a single-family home valued at 2.5 times their federal adjusted gross income (AGI), and
- reside and work in the largest city of the state for the 50-city comparison. Additional cities are used for the southern region and in-state comparisons.

Details of the assumptions used to develop the hypothetical families and their income and expenditure levels are shown on page 15. Using assumptions other than those stated would have produced somewhat different results. Expanding the number of hypothetical families to include lower and higher incomes or renters might have also altered the results.

#### New Orleans' Ranking Among the 50 Cities

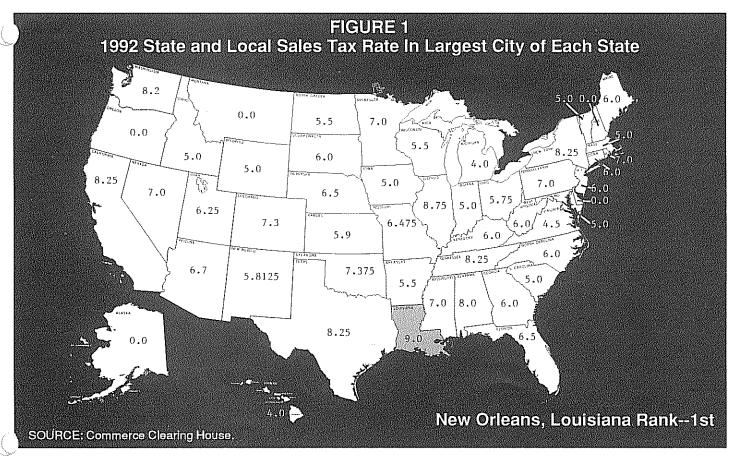

Total tax burdens (total state and local taxes plus the federal income tax) could differ substantially depending on the city and state of residence. (See tables 1A through 1D.) Total family tax burdens in New Orleans were relatively low, ranking 44th, 38th, 37th and 38th for the \$25,000, \$50,000, \$75,000 and \$100,000 income families, respectively. Total taxes paid by the families in New Orleans ranged from \$532 to \$1,157 below the 50-city average.

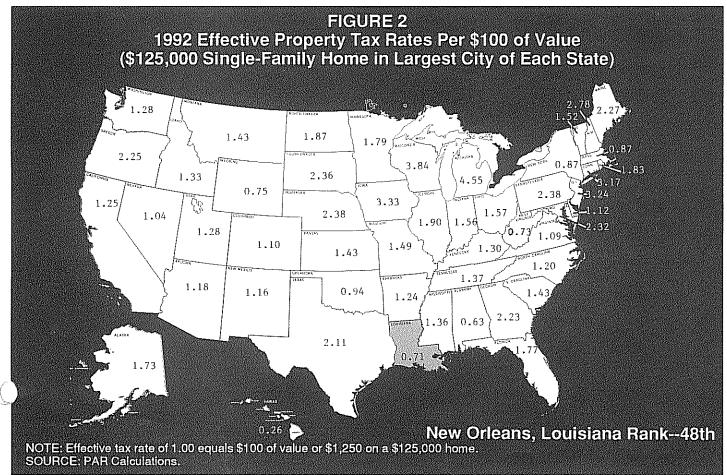

(See Table 2.) However, federal income taxes paid by the families in New Orleans were well above average; ranging from first (tied with nine other cities) to eighth highest.

State and local auto taxes, income taxes, residential property taxes and sales taxes were added together to form the total state and local tax bill. The families in New Orleans paid relatively low total state and local taxes, ranging from \$1,381 at the \$25,000 income level (45th) to \$7,726 (40th) at the \$100,000 income level. These amounts were \$622 to \$1,969 below the 50-city average state and local total taxes.

Even though total state and local taxes were low in New Orleans at each income level, two out of four of the specific state and local taxes paid by the families were relatively high at all income levels. New Orleans had the highest sales tax rate (9.0%) of all 50 cities. (See Figure 1.) Therefore, at each income level, the sales taxes paid in New Orleans ranked the highest, with family sales taxes ranging from \$390 to \$918 above the 50-city average. The auto taxes paid by the families in New Orleans also were among the highest, ranking from 8th to 16th.

In contrast, the residential property taxes and state income taxes paid in New Orleans ranked low at all income levels. The \$25,000 income family paid the lowest property tax of all 50 cities (only \$65) and the \$100,000 income family's bill of \$2,900 ranked 39th. In a 50-city comparison of effective residential property tax rates on a \$125,000 home, New Orleans' rate ranked third lowest at 71 cents per \$100 of market value. (See Figure 2.) The state income taxes paid by the families in New Orleans were also relatively low, ranking in the lower third at all income levels, with the highest rank of 33rd occurring at the \$25,000 income level. (Note: As of 1992, Louisiana and 36 other states prohibited a local income tax. Of the 13 states that allowed localities to tax income, only nine cities examined in this study did so.)

## Makeup of the Tax Burden

On a 50-city average, the federal income tax accounted for 40.9% and 47.2% of the two lower income families total tax burden and 52.5% and 56.9% of the two higher income families total tax burden. However, in New Orleans, all the families paid at least 51.6% of their total taxes to the federal government. (See Table 3.)

Residential property taxes made up the largest share of the 50-city average state and local total tax burden at all income levels, followed by state and local income taxes, sales taxes and auto taxes. (See Table 4.) The only exception to this was at the \$75,000 income level where auto taxes accounted for a larger share of the burden than sales taxes.

In New Orleans, the makeup of the state and local tax bill followed the same order as the 50-city average at the \$75,000 and \$100,000 income levels. Yet, at the two lower income levels the sales and auto taxes were of much greater importance, and property taxes fell in importance.

Compared to the 50-city average, the percentages of state and local taxes paid by New Orleans families were 2.5 to 3 times higher for sales taxes, somewhat higher for auto taxes, and generally lower for both residential property taxes and income taxes.

Federal Incom New	TABLE 3 e Tax as a Percentage of Orleans and 50-City Av	of Total Taxes: erage
<u>Income</u>	New Orleans	50-City <u>Average</u>
\$25,000	51.6%	40.9%
\$50,000	54.7	47.2
\$75,000	60.2	52.5
\$100,000	63.8	56.9

#### Combined Tax Burden

The state and local total tax burdens for all four families were combined and the totals ranked as shown on Table 5. The combined taxes collected from the four families in each of the 50 cities varied significantly from a high of \$44,330 in Detroit, Michigan to a low of \$9,638 in Cheyenne, Wyoming. The \$18,180 combined state and local tax bill paid by the four families in New Orleans ranked 42nd and was \$5,073 below the 50-city average.

Cities with the highest combined state and local taxes tended to rely most on state and local income taxes or residential property taxes. In contrast, cities with lower combined state and local total tax burdens tended to use residential property taxes or state and local income taxes very little, if any. They also tended to rely more on sales taxes than the higher tax burden cities. This was true in New Orleans where sales taxes were the highest of all 50 cities and the residential property tax was one of the lowest.

#### Deductibility of Taxes

Of the taxes examined in this study, the state and local income tax, the residential property tax and the auto property tax were deductible for federal income tax purposes. Most of the hypothetical families were able to itemize deductions. Therefore the federal income tax paid by families of the same income varied by as much as \$308 at the \$25,000 income level and \$4,410 at the \$100,000 income level, depending on the amount of state and local taxes which could be itemized as deductions. (See tables 1A through 1D.)

AVeriage		\$26,256	

Families that lived in cities that relied heavily on federally deductible state and local taxes and that imposed higher taxes on those deductible taxes paid less federal income taxes than families in other cities. For example, 95.4% of the \$19,228 state and local taxes paid by the \$100,000 family in Detroit, Michigan were deductible from the federal income tax and the \$10,053 federal income tax bill was the lowest of all 50 cities. In contrast, the same family in Cheyenne, Wyoming paid \$3,761 in state and local taxes, of which only 50.0% was deductible resulting in the highest federal income tax bill (\$14,463).

In New Orleans, less than 73.5% of the state and local taxes paid were deductible for federal income tax purposes, in part, because Louisiana state and local governments relied heavily on the sales tax which was not deductible.

To examine the impact of deductibility on Louisiana families' total tax burdens, PAR devised a scenario where the amount of sales taxes paid by each of the four hypothetical families in New Orleans was reduced by half and the amount of property taxes was increased by an equivalent amount. The federal and state income taxes were then recalculated. These changes resulted in a decreased tax burden for all but the lowest income family which was unable to itemize deductions. The savings would have ranged from \$102 at the \$50,000 income level to \$282 at the \$100,000 income level. (See Table 6.)

Most of the decrease was accounted for by a lower federal income tax. The income tax paid to the state of Louisiana was lowered slightly (\$20-\$30) because Louisiana taxable income was calculated after both itemized deductions and federal income taxes paid were subtracted from federal AGI. The increase in itemized deductions (\$562, \$648 and \$861) more than offset the decrease in federal income taxes paid at the three

## TABLE 6 Difference in Taxes Pald in New Orleans If Property Taxes Increased and Sales Taxes Lowered\*

	\$25.0	000 Income	\$50.0	00 Income	\$75,0	00 Income	\$100,000 Income

Sales Tax	855	(355)	582	(582)	668	(668)	891	(891)	
Property Tax	420	355	1,467	582	2,560	668	3,791	891	
Auto Taxes	281	0	486	0.0	850	0	989	<u>0 iii 1</u>	
Total State/Local Taxes	\$1,381	\$0	\$3,450	(\$20)	\$5,583	(\$20)	\$7,696	(\$30)	
TOTAL	\$2,855	\$0	\$7,564	(\$102)	\$13,886	(\$202)	\$21,053	(\$282)	

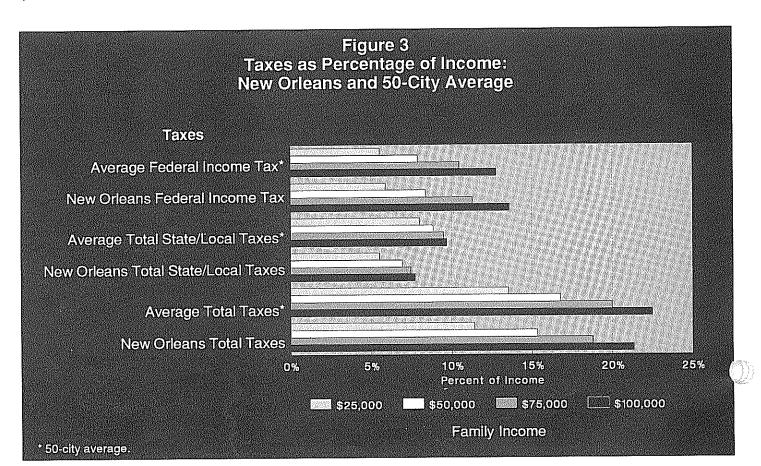

The amount of sales taxes paid was halved, and that amount added to the property taxes already calculated for the hypothetical family in New Orleans. Federal and state income taxes were then recalculated based on the revised numbers.

highest income levels. Therefore, any tax structure change that would raise the amount of itemized deductions for federal income tax purposes would lower both the federal income taxes and state income taxes paid by a family in New Orleans.

#### Regressivity/ Progressivity of Taxes

The 50-city average family paid 13.5% of their income to total taxes at the \$25,000 income level, 16.8% at

the \$50,000 income level, 20.0% at the \$75,000 income level and 22.5% at the \$100,000 income level. (See Figure 3.) The 50-city average total tax structure was progressive in effect because the percentage of taxes paid increased as income increased. Much

of this progressivity was due to the rogressive design of the federal income tax. In contrast, a tax structure in which the percentage of taxes paid decreases as income increases is said to be regressive. A tax system in which the percentage of taxes paid remains the same regardless of income is considered proportional.

At least among the income levels examined in this study, the 50-city average of the total state and local tax structure was also progressive. (See Figure 3.) The percentage of family income paid in state and local taxes at the \$25,000 income level was divided by the percentage paid at the \$100,000 income level to develop a regressivity index (See Table 7, where 1.00 equals a proportional tax system, greater than 1.00 is a regressive tax system and less than 1.00 is a progressive tax system.) This index shows that the state and local tax structure in New Orleans was slightly more progressive (0.71) than that of the 50-city average (0.83). Of the 50 iocalities examined, only ten had regressive state and local tax systems.

Of the four specific state and local taxes examined, only the income tax was very progressive, on average. (See Figure 4). For the 50-city average, the auto taxes and residential property taxes were almost proportional, while the sales tax was regressive in relation to income.

In New Orleans, auto taxes were nearly proportional, mirroring the 50city average. (See Figure 4.) The income tax in Louisiana was less progressive than that of the 50-city average, and the local residential property tax structure was far more progressive than that of the 50-city average. The progressive residential property tax structure was due to Louisiana's generous homestead exemption which effectively exempted up to \$75,000 of the market value of a home in New Orleans from all but 0.47 mills of residential property Axes. In contrast, the high rate and the broad base of the sales tax in New Orleans resulted in the sales tax being much more regressive than the 50city average.

## TABLE 7 Regressivity/Progressivity Index For Total State and Local Taxes

As expected, the types of state and local taxes relied on most affected the overall regressivity or progressivity of a city's taxing structure. The cities with the most progressive tax structure used a graduated income tax rate and did not rely heavily on sales taxes. In contrast, the localities with the most regressive tax structure did not levy an income tax, or did so only at the higher income levels, and relied more on sales taxes.

#### Southern Region Comparison

The largest city and the capital city of each of the 15 southern states, and the eight largest cities in Louisiana were compared to determine regional patterns if any, possible effects of population size, and tax burden variations within states. To simplify the comparison, only the \$50,000 income level family was analyzed. (NOTE: Some of the largest cities were also capital cities.)

At this income level, the total tax burden of the families living in the press cities in the southern states rended to be distributed fairly evenly throughout the national rankings, and thus no regional patterns were observed. There also did not appear to be any relationship between city size and family tax burden, nor did living in a capital city systematically influence a family's total tax burden. However, on average, the southern capitals' state and local tax structure relied less on residential property taxes (40.7%) and more on the sales tax (19.0%) than the 50-city average (47.8% and 12.3%).

Tax burdens in some cases differed more between cities within a state than between the cities of different states. (See Table 8.) For instance, the total tax burden of a family in Annapolis, Maryland (\$8,381), was closer to that of the same family in Jackson, Mississippi (\$8,426) than that of the Baltimore, Maryland family (\$9,426).

#### Louisiana's Largest Cities

The eight largest incorporated cities in Louisiana were examined. (See Table 9.) As noted in the southern-state comparison, tax burdens may vary widely within a state, this was also true for Louisiana where the total state and local tax burden varied by as much as \$361 at the \$25,000 income level to \$2,240 at the \$100,000 income.

Of the eight Louisiana cities, the state and local taxes paid by families in New Orleans ranked the highest at all, except the \$25,000 income levels. The \$25,000 income level family that lived in Shreveport paid the highest total state and local taxes, while the other three families living there paid the second highest taxes. In New Orleans, the high sales tax rate and the property tax on automobiles resulted in the above average family tax burdens. Whereas Shreveport's high ranking was due to the relatively high municipal property tax millages that were not covered by the homestead exemption. At all income levels, families in Houma and Baton Rouge had the lowest taxes. The low taxes were due in part to Baton Rouge's relatively low property tax rate and Houma's relatively low sales tax rate.

New Orleans' total tax burden placed in the lower third of the national rankings, but ranked highest among the cities in Louisiana. Therefore, if the eight selected Louisiana cities were compared to the largest cities in each state, the cities would consistently rank in the lower third with their total tax burdens, falling well below the 50-city average. Of the 30 southern cities examined, the total taxes in the eight cities in Louisiana ranked in the lower half. (See Table 8.)

#### Analysis of 1993 Tax Proposals

In the 1993 Executive Budget, Governor Edwards proposed a plan to raise an estimated \$370 million by suspending the one-cent sales tax exemption on food and utilities, adding a 5.75 mill residential property tax, and increasing the gasoline tax by ten cents per gallon. To ascertain the effects the suggested plan would have on family tax burdens, the proposed taxes were applied to the hypothetical families in New Orleans.

The Governor's plan would have resulted in an increased tax burden for all families (\$98, \$163, \$246, and \$274 respectively). (See Table 10.) It would have also moved New Orleans up in the 50-city ranking by one place at the \$25,000 income level, four at the \$50,000 income level, two at the \$75,000 income and four at the \$100,000 income level.

During the 1993 special session, the Governor also recommended a one-cent sales tax increase on all items except for food and utilities to raise an additional \$350 million in state revenues. As seen on Table 10, this change would have resulted in the tax burdens of the New Orleans' families increasing slightly and the rankings moving up at least one place in the 50-city rankings.

Ultimately, only one element of the proposed packages was adopted—the suspension of the sales tax exemption which was estimated to raise \$96.5 million. Passage of this proposal resulted in an increased tax bill of \$44, \$63, \$62 and \$82 for each of the four families examined, respectively.

Each of the tax plans were regressive—as a percentage of income. The tax hikes would have taken a larger share of the family income at the lower income levels. This was as expected because, as discussed earlier, both sales taxes and auto taxes are, in effect, regressive.

#### Comment

Comparing family tax burdens in the largest cities of each state, the southern region, the southern capitals and the eight largest cities in Louisiana shows that the tax burdens of Louisiana families would differ markedly if they were residents of other states, or even of another city in Louisiana. The total tax burden of a family was lower in New Orleans than most cities, however a larger per centage of the total and a larger dolla amount went to the federal government. The federal income taxes paid and the total tax burden of Louisiana families could be lowered if reliance was shifted away from sales taxes (nondeductible taxes) to property taxes or income taxes (deductible taxes). Such a shift would also slightly reduce the state income taxes paid by the families.

#### SOURCES AND ASSUMPTIONS

Information on tax rates, exemptions, credits and rebates were obtained from Commerce Clearing House publications unless otherwise noted.

Four hypothetical families were used with gross federal income levels of \$25,000, \$50,00, \$75,000 and \$100,000. Each family consisted of two working spouses and two school-age children. The families in the two lower income brackets each owned one automobile while those in the upper two income brackets owned two automobiles. Each family was assumed to itemize their federal income tax whenever possible and to file joint income tax returns. The more detailed assumptions used to develop the specific tax burdens of each family are outlined below.

#### Individual income Tax

Each family's income was divided as follows:

1992 Federal <u>AGI</u>	Wages and <u>Salaries</u>	<u>Interest</u>	Long-Term Capital <u>Gains</u>
\$25,000 Spouse 1	\$17,200	\$ 400	\$0
Spouse 2	7,400		
\$50,000 Spouse 1	\$34,000	\$1,000	\$0
Spouse 2	15,000	, ,	•
\$75,000 Spouse 1	\$49,000	\$2,000	\$3,000
Spouse 2	21,000	,	
\$100,000 Spouse 1	\$65,000	\$3,000	\$4.000
Spouse 2	28,000	<b>.</b> - <b>.</b>	, .,

Wage and salary income was assumed to be split 70/30 between the two spouses. All other income was assumed to have been split evenly. Each family was assumed to own a single-family home with their residence located within the city limits. All income was assumed to have been earned within the family's city of residence.

Each family was assumed to have \$0 federal and state/local tax refunds from the previous year.

Itemized deductions used in computing income taxes were:

; 1992 <u>Deduction</u>	<u>\$25,000</u>	Federa \$50,000	al AGI \$75.000				
Medical (Gross) Deductible Taxes		\$1,800 I personal pro s computed a					
Mortgage Interest Contributions	\$4,236 \$700	\$9,201 1,500	\$12,707 2,200	\$16,942 3,000			

Turbotax 1992 federal and state income tax computer software was used to compute these taxes for each family in each state.

#### **Property Tax on Residence**

Each family was assumed to have purchased their home in December 1991 with the first mortgage payment due in January 1992. The value of the house was equal to 2.5 times the federal AGI for that family. It was assumed that the mortgage principal equaled 80% of the value and the interest rate was 7.5% on a 30 year loan.

Rather than adjust housing values for each city to account for price differences, a set value for each income group was used. This was done to avoid reflecting differences in housing values and market conditions and instead focus on the difference in property taxes for the same value residence. It is acknowledged that in some cases, the city's economy might not result in a house of that value existing as a single-family dwelling, but again the purpose is to reflect differences in tax burdens in a hypothetical situation not differences in housing and market conditions.

Local property tax rates and assessment ratios were obtained from VERTEX National Property Tax Manuels, Commerce Clearing House (CCH) or by contacting local assessors or the local Governmental Research Association organization for assistance.

All property tax calculations reflect homestead exemptions if applicable. Credits given for property taxes on local or state income taxes are reflected in a lower income tax level. Rebates which were given independent of local or state income taxes were subtracted from the state and local total tax burden and so footnoted on the appropriate table.

#### Sales and Use Tax

Sales taxes were computed based on the average dollar amount spent at various income levels as provided by the Bureau of Labor Statistics 1991 Consumer Expenditure Survey. Major categories of average expenditures were selected rather than total average expenditures in order to effectively reflect the different sales tax exemptions applied by states and localities. The various categories of consumption used were purchases of food for home consumption; food purchased for consumption on the premises; utilities, fuels and public services; apparel and services; personal care products and services; and household furnishings and equipment.

#### <u>Automobile Taxes</u>

The automobile taxes included were the gasoline tax, motor vehicle registration fees, personal property taxes levied on automobiles and other annual taxes based on the value of the automobile which would be deductible from federal income taxes. This study used the same automobile assumptions as that used by the June 1992 District of Columbia study, Tax Hates and Tax Burdens in the District of Columbia: A Nationwide Comparison, and a table outlining these assumptions follows.

#### 1991 Automobile Tax Assumptions

	M. David M. Part No. Physics Christian II (Christian School				MA	RKET VALUES	Charles Books (b)	ESTIMATED MILEAGE	ESTIMATED ANNUAL
